

(cont'd)

$$\text{Ex} \quad u'' - k^2 u = 0$$

$$B_1 u = u(0) - u'(0)$$

$$B_2 u = u(1) = 0$$

$k=0$

$$u'' = 0 \Rightarrow u(x) = Ax + B : \text{general solution}$$

$$u'(x) = A$$

$$\left. \begin{array}{l} B_1 u = u(0) - u'(0) = B - A = 0 \\ B_2 u = u(1) = A + B = 0 \end{array} \right\} \Rightarrow A = B = 0$$

$\therefore u(x) \equiv 0$ is the only solution of the homog. problem

$\therefore \exists G(x, \xi)$ when $k=0$.

Hence, $G(x, \xi)$ exists for $k \geq 0$.

Let's find it. BCs are separated, so we can use "u₁, u₂ approach". These solutions u₁, u₂ satisfy

$$u'' - k^2 u = 0$$

Let's consider the case when $k > 0$. The case $k=0$ is easier.

e^{kx}, e^{-kx} : linearly independent

$\sinh kx, \cosh kx : -/-$

$\sinh k(x-1), \cosh k(x-1) : -/-$

$$u_1: u_1 = A \sinh kx + B \cosh kx$$

$$B_1 u = u(0) - u'(0) = B - kA = 0 \Rightarrow B = kA$$

$$u_1 = A \sinh kx + kA \cosh kx = A(\sinh kx + k \cosh kx)$$

Choose

$$u_1 = \sinh kx + k \cosh kx$$

$$u_2: u_2 = A \sinh k(x-1) + \beta \overset{0}{\cosh} k(x-1)$$

$$B_2 u = u(1) = \beta = 0 \Rightarrow \text{choose } u_2 = \sinh k(x-1)$$

Put

$$G(x, \xi) = \begin{cases} A(\sinh kx + k \cosh kx) \sinh k(\xi-1) & 0 \leq x < \xi < 1 \\ A(\sinh k\xi + k \cosh k\xi) \sinh k(x-1), & 0 \leq \xi < x \leq 1 \end{cases}$$

Note: $G(x, \xi)$ is CTS at $x = \xi$ automatically.

at $x = \xi$:

$$u'' - k^2 u = \delta(x - \xi)$$

Jump condition:

$$\int_{x=\xi^-}^{x=\xi^+} (u'' - k^2 u) dx = \int_{x=\xi^-}^{x=\xi^+} \delta(x - \xi) dx$$

$$\Rightarrow \left[\frac{dG}{dx} \right]_{x=\xi^-}^{x=\xi^+} = 1$$

$$\frac{dG}{dx} = \begin{cases} Ak(\cosh kx + k \sinh kx) \tanh k(\xi - 1), & x < \xi \\ Ak(\sinh k\xi + k \cosh k\xi) \cosh k(x-1), & x > \xi \end{cases}$$

$$\left[\frac{dG}{dx} \right]_{x=\xi^-}^{x=\xi^+} = \frac{dG}{dx} \Big|_{x=\xi^+} - \frac{dG}{dx} \Big|_{x=\xi^-} =$$

$$= Ak(\sinh k\xi + k \cosh k\xi) \cosh k(\xi - 1) -$$

$$- Ak(\cosh k\xi + k \sinh k\xi) \tanh k(\xi - 1) = 1$$

Note

$$\sinh(a \pm b) = \sinh a \cdot \cosh b \pm \cosh a \cdot \sinh b$$

$$\cosh(a \pm b) = \cosh a \cdot \cosh b \pm \sinh a \cdot \sinh b$$

$$Ak \left[(\sinh k\xi + k \cosh k\xi) (\cosh k\xi \cdot \cosh k - \sinh k\xi \cdot \sinh k) - \right. \\ \left. - (\cosh k\xi + k \sinh k\xi) (\sinh k\xi \cosh k - \cosh k\xi \cdot \sinh k) \right] = 1$$

$$Ak \left[k \cosh k \cdot \cosh^2 k\xi - \sinh k \cdot \sinh^2 k\xi - k \cosh k \sinh^2 k\xi + \right. \\ \left. + \sinh k \cdot \cosh^2 k\xi \right] = 1$$

$$Ak \left[\cosh^2 k\xi (\sinh k + k \cosh k) - \sinh^2 k\xi (\sinh k + k \cosh k) \right] = 1$$

$$Ak (\cosh^2 k\xi - \sinh^2 k\xi) (\sinh k + k \cosh k) = 1$$

$\brace{= 1}$

$$A = \frac{1}{k(\sinh k + k \cosh k)}$$

Hence,

$$G(x, \xi) = \begin{cases} \frac{(\sinh kx + k \cosh kx) \sinh k(\xi - 1)}{k(\sinh k + k \cosh k)}, & 0 \leq x < \xi \leq 1 \\ \frac{(\sinh k\xi + k \cosh k\xi) \sinh k(x - 1)}{k(\sinh k + k \cosh k)}, & 0 \leq \xi < x \leq 1 \end{cases}$$

5

Symmetry in x and ξ as expected since $\mathcal{L} = \mathcal{L}^{\frac{1}{k}}$.

We can consider asymptotic expansions of $G(x, \xi)$ for, say, k being small.

$0 \leq x, \xi \leq 1$, k is small $\Rightarrow kx, k\xi$ are small
 $\& k(x-1), k(\xi-1)$

Note

$$\sinh z = z + \frac{z^3}{3!} + \frac{z^5}{5!} + \dots$$

$$\cosh z = 1 + \frac{z^2}{2!} + \frac{z^4}{4!} + \dots k \cdot (1 + \dots)$$

$$x < \xi \quad G(x, \xi) = \frac{\left(kx + \frac{(kx)^3}{3!} + \dots \right) \left(k(\xi - 1) + \dots \right)}{k(k + \dots + k \cdot 1 + \dots)} =$$

$$= \frac{k(x+1) \quad k(\xi - 1) + O(k^3)}{2k^2 + O(k^3)} \approx \frac{(x+1)(\xi - 1)}{2}$$

for small k

Similarly, for $x > \xi$.

Ex Problem #1, HW #9.

$$Lu = u'' - u = f(x)$$

$$B_1 u = u(1) - 2u(0) = C_1$$

$$B_2 u = u'(1) = C_2$$

$L = L^*$. BCs are mixed/unseparated, and $\mathcal{L} \neq \mathcal{L}^*$

Homogeneous problem:

$$u'' - u = 0$$

has linearly independent solutions $\cosh x$ and $\sinh x$.

The general solution is

$$u(x) = A \cosh x + B \sinh x$$

$$B_1 u = u(1) - 2u(0) = A \cosh 1 + B \sinh 1 - 2A = 0$$

$$B_2 u = u'(1) = A \sinh 1 + B \cosh 1 = 0$$

$$\begin{pmatrix} \cosh 1 - 2 & \sinh 1 \\ \sinh 1 & \cosh 1 \end{pmatrix} \begin{pmatrix} A \\ B \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\det(\dots) = \cosh 1 (\cosh 1 - 2) - \sinh^2 1 = \cosh^2 1 - 2 \cosh 1 - \sinh^2 1 = \underbrace{\cosh^2 1 - \sinh^2 1}_{=1} - 2 \cosh 1 = 1 - 2 \cosh 1 = \\ = 1 - (e^1 + e^{-1}) \neq 0$$

Hence, $A = B = 0$, i.e. homog. BVP has only trivial solution $\Rightarrow \exists G(x, \xi)$ and it is !.

Find $G(x, \xi)$. BCs are mixed.

Problem for $G(x, \xi)$:

$$L G(x, \xi) = \delta(x - \xi)$$

$$B: G = 0$$

for $x \neq \xi$, G satisfies homog. ODE. The homog. solution will differ for $x < \xi$ and $x > \xi$.

Put

$$G(x, \xi) = \begin{cases} C \cosh x + D \sinh x & 0 \leq x < \xi \leq 1 \\ E \cosh(1-x) + F \sinh(1-x), & 0 \leq \xi < x \leq 1 \end{cases}$$
