## ODOT Long-Life Pavement Design & Construction

René A. Renteria, P.E.  
ODOT Pavement Design Engineer  
Salem, Oregon

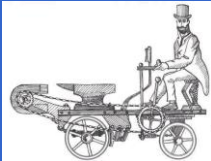

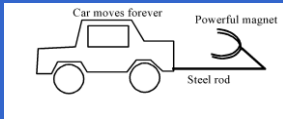

Oregon Department of Transportation

## What is a Long-Life Pavement?

- **Mechanistic-Empirical Design Guide - MEPDG (2008)**
  - **Long-Life Pavements** – Flexible or rigid pavements that have been designed for 50+ years. Long-life pavements are also referred to as perpetual pavements.
  - **Endurance Limit** – The endurance limit is defined as the tensile strain or stress below which no load-related fatigue damage occurs. (User input of value)

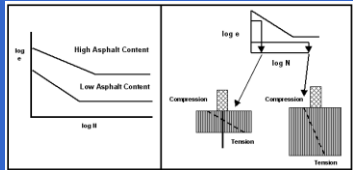

Oregon Department of Transportation

## What Happened to Terminology “Perpetual Pavements”?

Oregon Department of Transportation

## Mechanics of Materials

- Asphalt Content  $\uparrow$ , Fatigue Resistance  $\uparrow$
- Thin Pavement = Higher Strain,  $N_f \downarrow$
- Thick Pavement = Lower Strain,  $N_f \uparrow$
- Endurance Limit – assumed as 70 microstrain, “unlimited” repetitions

Oregon Department of Transportation

### Concept for Long-Life Pavement

Zone of High Compaction 4 to 6 in.	High-Quality HMA or GSF C. 1.5 to 3 in.
High Modules, Rut Resistant Material 4 to 7 in.	
Maximum Tensile Strain	Fatigue Resistant Material 3 to 4 in.
Pavement Foundation	

- Wearing Course At Surface
- Rut Resistant Intermediate Base Layer
- Fatigue Resistant And Durable (High Binder Content) Bottom Base Layer

(TRC No. 503, 2001)

Oregon Department of Transportation

### Concept for Long-Life Pavement

- minimize/eliminate bottom-up cracking, maintain durability
- periodically repair/replace top-down cracking in wearing course
- Top-down cracking can be dealt with through "mill and fill"

**Is top-down cracking a long-term problem?**

Oregon Department of Transportation

### Concept for Long-Life Pavement

- **ASSUMPTION A:** endurance limit is applicable to any mix at any temperature
- **ASSUMPTION B:** top-down cracking is not a structural problem
- **ASSUMPTION C:** we can predict traffic and materials performance out to 50 years

Oregon Department of Transportation

### Assumptions for Long-Life Pavement

Oregon Department of Transportation

### ODOT Proposed Design Method for Long-Life Pavements

RESEARCH OF INTEREST

- Determining The Causes of Top-Down Cracks in Bituminous Pavements (Michigan State University PRCE, 2003)
- Phase III NCAT Test Track Findings (February 2009)
- Evaluation of Poisson's Ratio for Use in the MEPDG (Rutgers/NJDOT, 2008)

Oregon Department of Transportation

### Top-Down Cracking (PRCE)

- No design method is capable of predicting or analyzing TDC potential
- Causes of TDC can be summarized
  - High tensile stresses & strains induced by load/temp/construction
  - Low tensile strength or fatigue resistance of AC due to the AC mix properties
    - Aging or hardening of AC binder
    - Segregation, high in-place air voids

Oregon Department of Transportation

### Solutions for TDC (Emery)

- The key aspect... is enhanced cracking (tensile and shear fracture) resistance, while maintaining rutting resistance, through improved gradations and mix volumetrics,
- appropriate mix design performance monitoring and the use of asphalt binder modifiers such as polymers (crumb rubber and styrene-butadiene-styrene (SBS), for instance)

Oregon Department of Transportation

### MUS&T St by Binder vs. Va (Richardson & Lusher)

Tensile Strength: 21°C (70°F)

Binder Type	Air Voids (%)	Tensile Strength (psi)
06-84 (SMA)	4.0	240
06-101	6.0	230
06-125	4.0	180
06-150	7.0	150
Virgin binder = PG76-22	4.0	200
Virgin binder = PG76-22	9.0	180
Virgin binder = PG64-22	4.0	160
Virgin binder = PG70-22, 10% RAP	7.0	140

Legend:

- △ 06-84
- 06-101
- × 06-125
- 06-150
- Linear (06-84)
- - Poly (06-101)
- · - Linear (06-150)
- · · Poly (06-125)

Oregon Department of Transportation

### So that takes care of the top, what about the bottom?

Oregon Department of Transportation

### NCAT Temperature & Strain

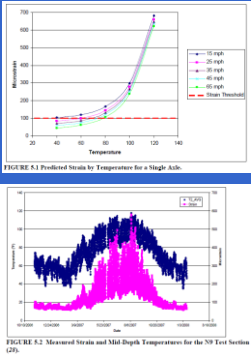

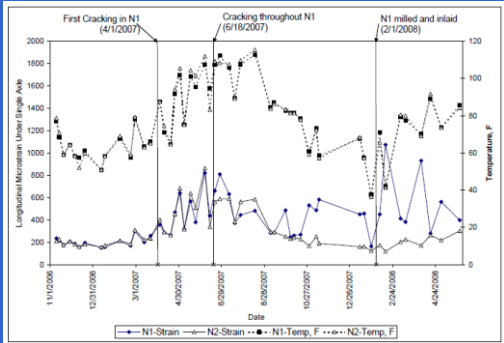

FIGURE 3.1 Predicted Strain by Temperature for a Single Axle

FIGURE 3.2 Measured Strain and Mid-Depth Temperatures for the 50-Ton Test Vehicle (2%)

Oregon Department of Transportation

### NCAT Bottom Strain vs. Time

Longitudinal Microstrain Under Single Axle

Temperature, F

Date

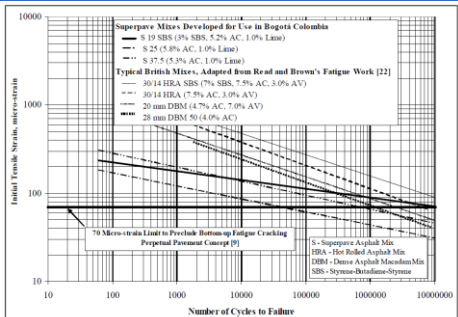

Legend: N1-Strain, N2-Strain, N1-Temp, F, N2-Temp, F

Key Events:

- First Cracking in N1 (4/1/2007)
- Cracking throughout N1 (6/18/2007)
- N1 milled and inlaid (2/1/2008)

Oregon Department of Transportation

### Canada (Emery) Fatigue-Mix Type

Initial Tensile Strain, microstrain

Number of Cycles to Failure

Legend:

- Superpave Mixes Developed for Use in Bogota Colombia
  - S 19 SBS (9% SBS, 5.2% AC, 1.0% Lime)
  - S 25 (5.8% AC, 1.0% Lime)
  - S 37.5 (5.3% AC, 1.0% Lime)
- Typical British Mixes, Adopted from Road and Brown's Fatigue Work [2]
  - 3014 HRA SBS (7% SBS, 7.5% AC, 3.0% AV)
  - 3014 HRA (7.5% AC, 3.0% AV)
  - 20 mm DBM (4.7% AC, 7.0% AV)
  - 20 mm DBM 50 (4.0% AC)

70 Microstrain Limit to Prevent Bottom-Up Fatigue Cracking Perpetual Pavement Concept [9]

S - Superpave Asphalt Mix  
HRA - Hot Rolled Asphalt Mix  
DBM - Dense Asphalt Macadam Mix  
SBS - Styrene-Butadiene-Styrene

Figure 3. Fatigue Characteristics of Typical British Asphalt Mixes and New Colombian Superpave Mixes Determined Using the Nottingham Asphalt Tester

 Oregon Department of Transportation 

***ODOT Proposed Design Method  
for Long-Life Pavements***

**USE MEPDG!**

- Seasonally adjust the HMA layers for temperature at layer mid-depth
- Seasonally Adjust Both The Unbound Aggregate Base Moduli and the subgrade
- Rutgers - Poisson's Ratio value does influence rutting, longitudinal cracking and fatigue—use MEPDG predictive or study

 Oregon Department of Transportation 

***ODOT Proposed Design Method  
for Long-Life Pavements***

- Define HMA Mix Characteristics Each Layer, Use Previous Project Data
  - ODOT Traditional use of ¾" Dense and ¾" Open Graded HMA
  - ODOT direction is toward ½" Dense HMA, more research of Open Graded HMA
  - ODOT to consider use of SMA or 3/8" Dense W.C., Polymer-modified

 Oregon Department of Transportation 

***ODOT Proposed Design Method  
for Long-Life Pavements***

**INTERSTATE DESIGN**

- Analyze Project-Specific proposed design section using MEPDG
  - Fatigue criteria of 95% reliability of 5% distress at 50 years
  - Meet rutting and longitudinal distress criteria of 95% reliability at 15 years (first rehabilitation)

 Oregon Department of Transportation 

***ODOT Proposed Design Method  
for Long-Life Pavements***

- MEPDG allows input of strain criteria
  - $\leq 70$   $\mu$ strain unless mix-specific data
  - What about effect of temperature & speed on strain criteria?
  - Future truck loading? Aging effect?**Use as a check, not for thickness determination**
- ✓ Total thickness is "optimal" section plus 1" (factor of safety)

Oregon Department of Transportation

### ODOT Proposed Long-Life Pavement Structure

Proposed ODOT Long-Life Pavement Structure		Ex.
1 - 2"	Wearing Course, Level 4-100, PG 76/70-28 ER (SBS polymer?) SMA or 3/8" Dense HMA, 4% Lab Air Voids, 94%+ Compaction RAP = 0-10%?, Minimum ITS = 100? Psi	2"
3 - 5"	Rut Resistant Base Course, Level 4-100, PG 70/64-xx 1/2" Dense HMA, 4% Lab Air Voids, 92%+ Compaction RAP = 0-30%, Minimum ITS=?	2"
3-6"	Intermediate Base Course, Level 4-100, PG 64-xx 1/2" Dense HMA, 4% Lab Air Voids, 92%+ Compaction RAP = 0-30%, Lime or Latex Treated?, Min. ITS=? psi	6"
3 to 6"	Rich Binder Base Course, Level 4-100, PG 64-xx 1/2" Dense HMA, 3% Lab Air Voids, 94%+ Compaction RAP = 0-10%, Lime or Latex Treated?, Min. ITS=100? psi	3"
4"? 10"+	Dense-Graded Aggregate TOP Base (free-draining) Dense-Graded Aggregate Base	=13"

Oregon Department of Transportation

### ODOT Proposed Construction for Long-Life Pavements

#### Rich Binder Base Course (RBBit?)

- Kept at Level 4 (100 gyros) until further investigation
- 3% lab  $V_a$  mix approx. +0.4-0.5% binder content compared to 4%  $V_a$  mix
- Lab:  $\uparrow$  VMA 13.5-18% VFA 70-82%
- Minimum 94% compaction
  - Has been obtained, with bonus

Oregon Department of Transportation

### ODOT Long-Life Pavement Projects

- **I-5 SB MP 239.6** (2005)
  - O.G./HMA/rubblized CRCP/DG Aggr Base
- **I-205 MP 0-3.0** (2007)
  - O.G./HMA/rubblized CRCP/CTB
- **I-5 Victory-Lombard Sec.** (2010)
  - D.G. or SMA?/HMA/DG aggregate base
- **I-5 South Medford Intc.** (2009)
  - D.G./HMA/DG aggregate base

Oregon Department of Transportation

### ODOT Instrumented Pavements

Oregon Department of Transportation

### ODOT Instrumented Sites

- On-going Research Projects (OSU)
  - Strain gauges at base of HMA
  - Thermistors in HMA for temperature
  - Weigh-in-Motion for wheel load weight
  - Photos of truck position in lane (truck wander location from fog line)
  - HMA cores for modulus testing
  - FWD deflections for back-analysis

Oregon Department of Transportation

### I-5 at MP 239.6 Instrumented Site

Oregon Department of Transportation

### I-5 at MP 239.6 Instrumented Site

**Pavement Instrumentation**

Oregon Department of Transportation

### I-5 at MP 239.6 Instrumented Site

2 in.	3/4 in. open-graded HMA wearing course	2 in.	3/4 in. open-graded HMA wearing course
10 in.	3/4 in. dense-graded HMA base course	10 in.	3/4 in. dense-graded HMA base course
16 in.	Aggregate base	8 in.	Rubbleized JRCPC
	Geotextile	9 to 12 in.	Original aggregate base course
	Subgrade soil		Subgrade soil

Oregon Department of Transportation

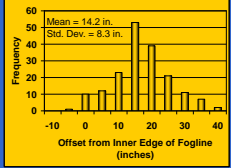

### I-5 at MP 239.6 Instrumented Site

- Predicted Tensile Strain, Bottom of HMA, Rubblized Section
  - <70 microstrain at typical loading
  - 70-92 microstrain, max loading, summer
- As-Built Condition over Rubblized
  - Actual HMA thickness +1.25 to +1.5 inch
  - Preliminary results from summer data

Oregon Department of Transportation

### I-5 at MP 239.6 Instrumented Site

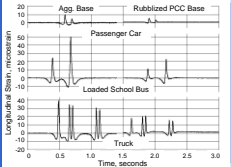

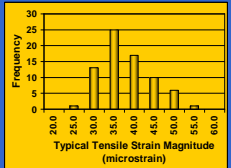

- Some Early Results
  - Truck Wander Determined from Photo Record
  - Trend Shows Lots of Wander in Lane

Oregon Department of Transportation

### I-5 at MP 239.6 Instrumented Site

- Various Loading
  - Passenger Car
    - <10 microstrain
  - Bus/Truck
    - <55 microstrain
- Typical Tensile Strain (summer)
  - 36 microstrain
- Maximum Tensile Strain (summer)
  - 55 microstrain

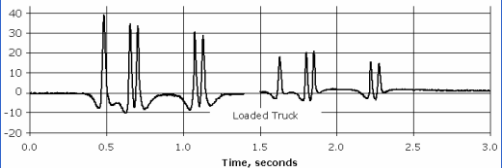

Oregon Department of Transportation

### ODOT Further Study

- What Is The Effect Of Improved (Higher Modulus) Aggregate Base?
  - Instrumentation of HMA over Rubblized PCC and Aggregate Base indicates:
    - for same loading/HMA thickness

Aggregate Base | Rubblized

Oregon Department of Transportation

### ODOT Further Study

- Early MEPDG trials
  - 1/2" Dense has better fatigue resistance over 3/4" Dense
  - PG 64-22 in RBBit better than PG 70-22
  - Questions raised
    - How much total rutting is too much?
    - How do we manage top-down cracking over 50 years?

Oregon Department of Transportation

### ODOT Further Study

What Alternative Wearing Course Designs Can We Use?

- Early SMA projects (1/2" NMAS) were not successful, current I-405 struggled, but not dead yet! Future 1/2" or 3/8" NMAS?
- Existing 3/4" Open Graded requires 2" lift, other less expensive OGFC?
- Use of 3/8" Dense Wearing Course is being explored

Oregon Department of Transportation

### Design and Construction for Long-Life Pavements

**Long-Life Pavement Success is only as good as the Assumptions!**

*'Cutting-Edge' Design  
Engineered Materials  
High-Quality Construction  
Appropriate Data Collection*
