

Evolution of Pavement Structural Design Systems

Chris Wagner, P.E.
FHWA Resource Center
Atlanta, GA
Christopher.Wagner@dot.gov

Why are pavements important ?

- ▶ Fundamental to economic growth and quality of life
- ▶ Pavement design is critical for **long lasting** and **economical pavements**

Major Advances in Pavement Design and Construction

- ▶ Roman Roads
- ▶ Telford Pavements
- ▶ Macadam Pavements
- ▶ German Autobahn
- ▶ US Interstate System
- ▶ China's highway expansion
- ▶ AASHTO Road Test
- ▶ Mechanistic Empirical Design
 - IlliSlab
 - Asphalt ME procedures
 - DARWin -ME

Pavement Design History

- ▶ Roman Roads
 - 312 B.C.

Source: www.asphaltwa.com

Pavement Design History

- ▶ McAdam Pavements

John McAdam
1756 - 1836

“Regardless of the thickness of the structure many of the roads in Great Britain deteriorated rapidly when the subgrade was saturated.”

German Autobahn, 1936

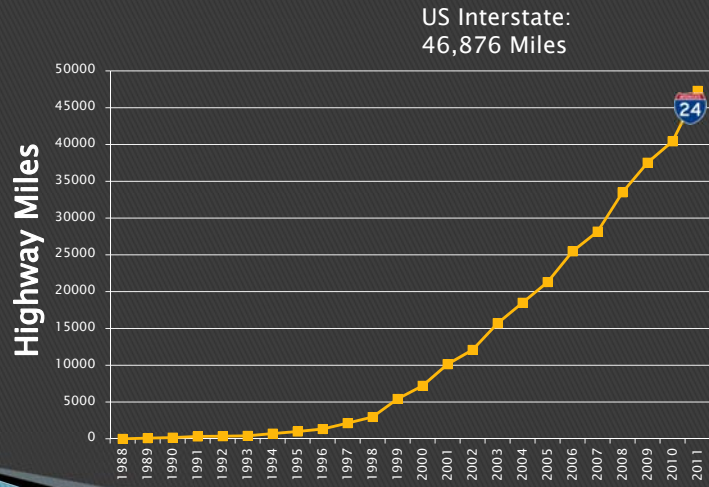

China's National Trunk Highway System

Installation of Lean Concrete Base material

China's National Trunk Highway System

1919 Transcontinental Convoy – July 7 – September 7

Grand Island, Nebraska

US Roadway Expansion

- 1956
 - President Eisenhower
- Funded by Gas Taxes
 - ~ \$38 Billion / Yr
- Responsible for NHS
 - Interstate
 - US Routes
 - 46,876 miles

The AASHO Road Test: A Look Back

Previous Road Test

- ▶ Road Test one – MD 1950
 - Concrete Pavement
- ▶ WASHO Road Test, Idaho 1953–54
 - Flexible Pavements

AASHO Road Test

- ▶ “Grand-daddy” of major road tests
 - 1956–1960
 - Studied both pavements and bridges
 - \$27 million (1956 \$)
- ▶ Long lasting effects in pavement engineering
- ▶ Cornerstone of pavement design

Project Location

- ▶ Ottawa, IL on future I-80 alignment
- ▶ “Representative” soil and climate
- ▶ Cooperation of host state
- ▶ Flexible and pavements and bridges

Experimental Design

- ▶ Statistically based experimental design to isolate variables
- ▶ Flexible pavements
 - Surface, base, and thickness
 - 100 to 160 ft long
 - 468 total sections
- ▶ Rigid pavements
 - Reinforcing, slab and base thickness
 - 120 to 240 ft long (all doweled joints)
 - 368 total sections

TABLE 2
PAVEMENT DESIGNS, RIGID TANGENTS

REINFORCING	SLAB THICKNESS (IN)	TANGENT					
		1	2	3	4	5	6
REINFORCED	2 1/2	X	X	X	X		
	3 1/2	X	X	X	X		
	5	X	X	X	X	X	
	6 1/2			X	X	X	X
	8			X	X	X	X
	9 1/2	X				X	X
NON-REINFORCED	2 1/2	X	X	X	X		
	3 1/2	X	X	X	X		
	5	X	X	X	X	X	
	6 1/2			X	X	X	X
	8			X	X	X	X
	9 1/2	X				X	X

Objectives

- ▶ To determine **relationships** between axle loads and pavement performance
- ▶ To determine **effects** of axle and vehicle loads on bridges
- ▶ To conduct **special studies** (base types, paved shoulders, fatigue, tire pressures, etc)
- ▶ To provide a record of the type and extent of effort/materials to **maintain** sections
- ▶ To develop test instrumentation, test procedures, graphs, charts, and formula helpful to highway **design and evaluation**

Construction

- ▶ 1956 to 1958
- ▶ Highly controlled
- ▶ Specifications based on prevailing SHA practices

Asphalt Paving

Concrete Paving

Truck Traffic

- ▶ Trucks driven by U.S. Army Transportation Corps
 - Initially 6 day schedule (18 hours, 40 minutes)
 - Later changed to 7 day (19 hours, 5 minutes)
 - Three rotating driving schedules (7.5 hours per driver each day)

Walt McKendrick

—Project Director—

“Take all the time you want as long as you are off the road when the trucks are back in service”

—to field staff inspecting pavement conditions

Performance Monitoring

- ▶ Flexible Pavements
 - Profile
 - Roughness
 - Cracking
 - Patching
 - Rut Depth
- ▶ Rigid Pavements
 - Profile
 - Cracking
 - Patching
 - Spalling
 - Joint/Crack Faulting

Monitoring Equipment

Profilometer

Benkelman Beam

GM Skid Trailer

Serviceability

- ▶ Introduced as way of measuring pavement performance and defining “failure”
- ▶ Correlations developed to estimate panel rating serviceability based on observed distress, e.g. for flexible pavements:

$$PSI = 5.03 - 1.91 \log(1 + SV) - 1.38(RD)^2 - 0.01 \sqrt{C_F + P_F}$$

Road Test Products

- ▶ Serviceability–performance concept
- ▶ **Pavement design models**
- ▶ Load equivalency factors
- ▶ **Recognition of variability in construction and need for statistical sampling**
- ▶ Demonstration of statistically based experimental designs and statistically based modeling
- ▶ **Development and implementation of new performance monitoring equipment**
- ▶ Framework for pavement and asset management

Limitations

- ▶ One subgrade type
- ▶ One environment
- ▶ Only 2 years of service
 - Limited truck traffic
 - Limited environmental effects
- ▶ One HMA mix
- ▶ One PCC mix
- ▶ 1950s materials & paving technology

*These factors limit the "inference space,"
not the validity of the results*

One Subgrade Type...

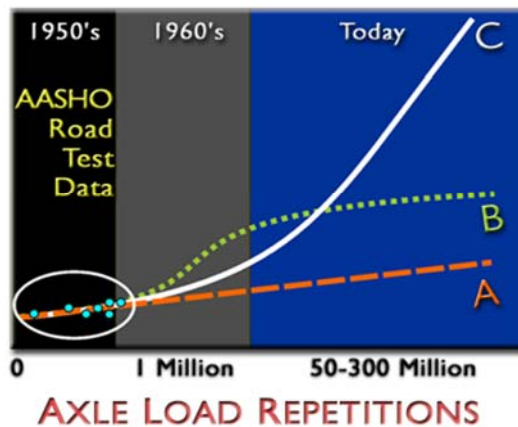

**A-6 / A-7-6 (Clay)
Poor Drainage**

(AASHO, 1961)

Low Traffic Levels...

PAVEMENT THICKNESS

Bill Carey

—Chief Engineer for Research—

"It was recognized that other models... could lead to correlation with subjective ratings just as good or perhaps even better than the correlation obtained with [the AASHO] model."

—1962 AC Pavement Conference

Alvin C. Benkelman

—Flexible Pavement Research Engineer—

“This is my third road test and if I don’t get it right this time they’ll fire me”

—Having also served at Hybla Valley and WASHO Road Tests

Frank Scrivner

—Rigid Pavement Research Engineer—

“Well over half of the [rigid pavement] sections under traffic exhibited very little change in condition during the two years of traffic testing”

—1962 St. Louis Proceedings

Paul Irick

—Chief, Data Processing and Analysis—

“...we aim to explore models for long time pavement performance that will bring in some of the physical parameters that are considered basic to the explanation of pavement performance.”

—1962 AC Pavement Conference

Fred “Mickey” Finn

“The Asphalt Institute is fully aware of the significant contributions which have been made and, just as important, which will be made by this Project to the highway engineer.”

—1962 St. Louis Proceedings

1993 Version

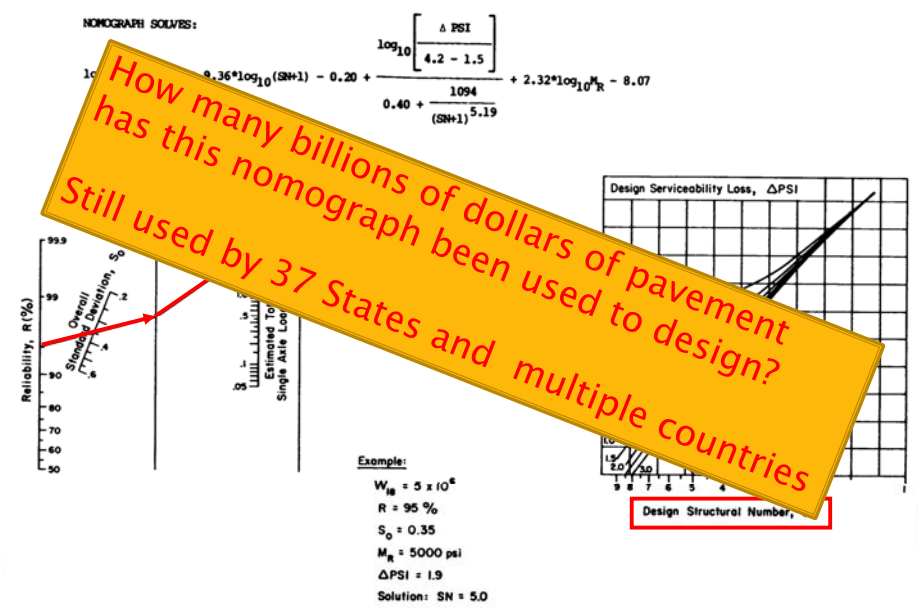

Figure 3.1. Design Chart for Flexible Pavements Based on Using Mean Values for Each Input

Mr. Fred Finn

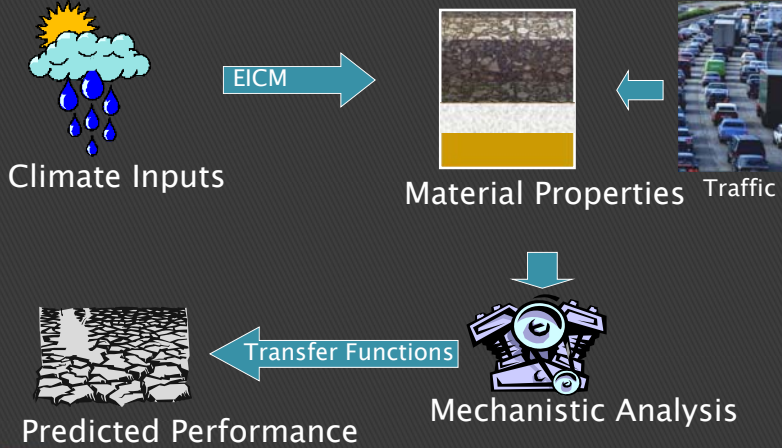

50 year step forward.....

Available December 2010

- Fundamental Materials Inputs
- Traffic Loadings
- Climatic Considerations
- Calibrated to research grade pavement sections

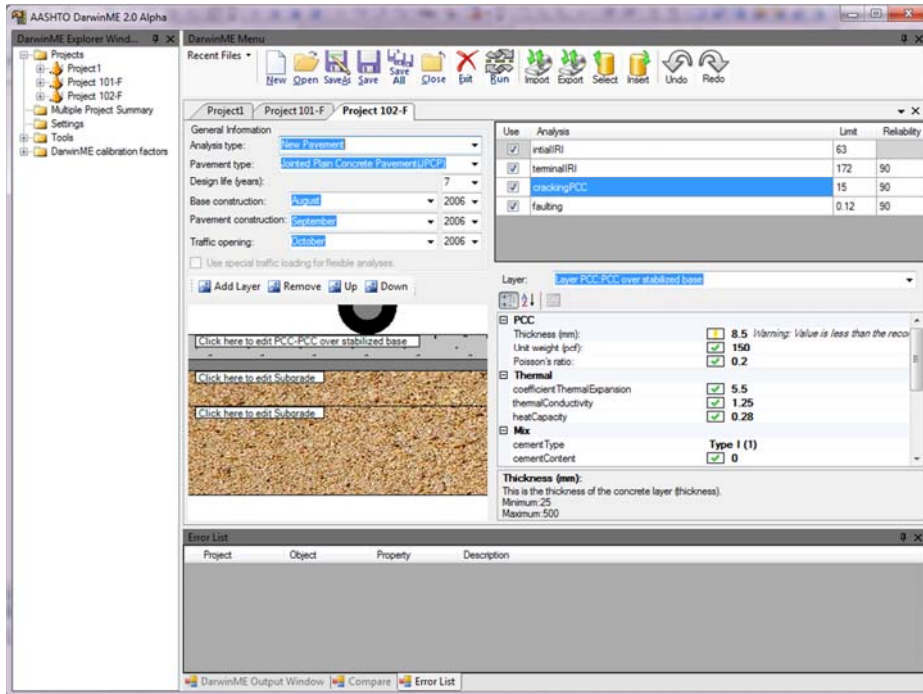

The Big Picture

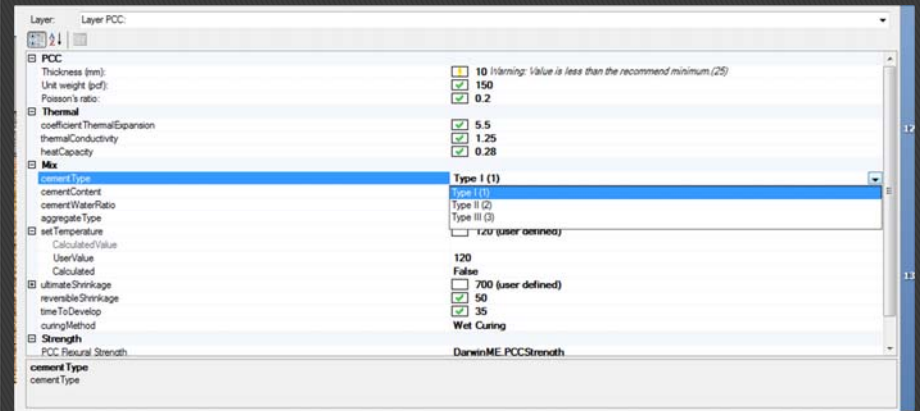

Structural Response Models – Elastic Layered and Finite Elements Tools

Evolution

- ▶ Pavement design is not perfect.....BUT;
- ▶ Were moving toward a more fundamental and structured platform for continuous improvement.

*Evolution
of Man*
