

Fish and Wildlife Population Ecology: The End Game...

Okaloosa Darters...

How are they doing?

- Choctawhatchee Bay drainage in Florida
- Inhabit vegetated sand runs of clear creeks
- Listed as Endangered June 4, 1973
- Fish and Wildlife Service has recommended downlisting to Threatened
- How would you determine their status??

Time Series of Abundance Estimates

Analysis of Population Growth Using Time Series Data

Select Excel Worksheet: Turkey Creek, Sheet2

Select Columns for Analysis:

Year	Abundance
1995	10,026
1996	5,206
1997	10,781
1998	13,477
1999	17,850
2000	14,553

Parameter Estimates:

Linear regression of log-abundance vs. time...
 μ_{est} : 0.0743127931
 $SE(\mu_{est})$: 0.0161119493
 P_{var} : NA
 Obs_{var} : 0.029554402

Model fit of exponential growth with process noise...
 $AICc$: -1.9537
 μ_{est} : 0.0760153827
 $SE(\mu_{est})$: 0.0549709572
 P_{var} : NA
 Obs_{var} : 0.0302190613

Model fit of exponential growth with process noise and observation error...
 μ_{est} : 0.0760153827
 $SE(\mu_{est})$: 0.0549624276
 P_{var} : 0.0302066845
 Obs_{var} : NA

R Console Output:

```
[2]
[1] 0.05496243
[3]
[1] 0
[4]
[1] 0.03020668
```

Which Model??

Model	AICc	DeltaAICc
Exponential	-1.953	0
Gompertz	2.21	4.19
Ricker	2.24	4.16
Theta-logistic	8.24	10.19

Past Abundance Data

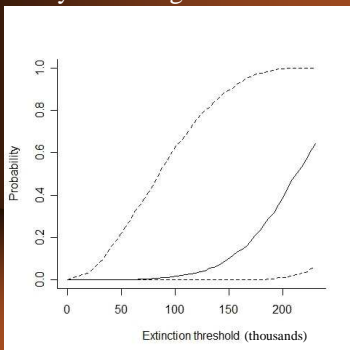

Future Projection

-Based on past data and an assumed model of growth

OK, Now What?

- Probability of Falling Below...

Golden-Cheeked Warbler (*Dendroica chrysoparia*)

- breeds in closed-canopy woodlands, primarily Ashe juniper and oak
- declined due to habitat loss and fragmentation from clearing of juniper for urban expansion, agriculture, and commercial harvest

Fort Hood Army Post

- Largest breeding population
- BIG fire in 1996
- Increased training demands

Recovery Credit System

- Fort Hood “buys” the conservation rights to habitat patches on private lands
- Unintentional loss of habitat on Fort Hood is “offset” by these purchases
- Golden-cheek metapopulation remains “unharmed”

How should off-post patches be valued?

The Model

- Stochastic, demographic-based, metapopulation projection model

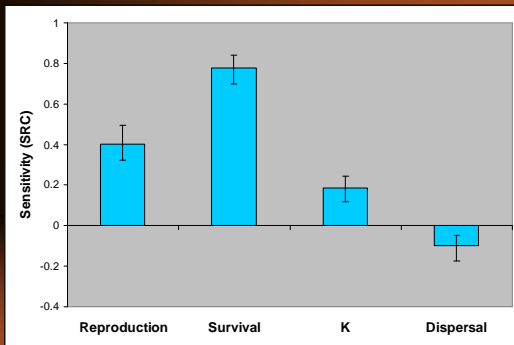

Stage ^a	S	Temporal Variance (S)	F^b	Temporal Variance (F)
HY	0.40	0.058	0	0
SY	0.57	0.010	1.2	0.024
ASY	0.57	0.010	1.3	0.006

The Model

- Ceiling carrying capacity (K)
- Various dispersal scenarios
- Metapopulation Viability
 - After 20 years...
 - Mean final population size?

Important Drivers of Metapopulation Viability

Importance of Individual Populations

However...

- Changing dispersal assumptions
- Changed conclusions, substantially!

Wolf Reintroduction to Northern Rockies

- What impact are wolves having on elk and deer populations in Idaho?
- What impact in future? – decreasing elk and deer, stable numbers or oscillations?
- How answer?
 - Ask experts and check scientific literature
 - Gather important data
 - Synthesize data and test possibilities with a model

Why model predator-prey interactions?

- Models help us
 1. Define our problem
 2. Identify what might be important
 3. Understand our data
 4. Communicate and test that understanding
 5. Make predictions

Modeling Wolf Effects

- What is important?
- What would determine their effect on elk and deer?
- Is there a theory of predator-prey interactions that will help us understand, predict and manage wolf predation on deer and elk?

Predicting effects of wolf reintroductions on ungulate populations: Comparing model predictions to observations for elk and wolves in Yellowstone.

- by Edward O. Garton¹, Douglas W. Smith², Bob Crabtree¹, Bruce Ackerman¹, and Gerry Wright¹
- 1. Fish and Wildlife Dept., University of Idaho, Moscow, ID 83844,
- 2. National Park Service, Yellowstone Center for Resources, P.O. Box 168, Yellowstone National Park, WY 82190

1990 Approach

- Evaluate dynamics of Northern Yellowstone Elk Herd using available data
- Predict characteristics of wolf population growth and predation from literature
- Build an empirically based projection model
- Validate portions of the model by comparing predictions to observed data

- 1990's predicted success for wolves
- Northern Yellowstone elk herd projected to be stable with high chance of persistence but average abundance depends on
 - Hunter harvest
 - Winter severity

Implications: Hunter Harvest

- Population trend for Northern Yellowstone Elk herd was very sensitive to:
- Human harvest rate
 - @ 9% harvest ('70-'80s) - Stable with wolves
 - @ 11% harvest ('95-'05) - Declines with wolves
 - @ 7% harvest - Increases with wolves
 - @ 9% harvest - Increases without wolves

Implications: Winter Severity

- Population trend for Northern Yellowstone Elk herd at current size is very sensitive to:
- Winter severity:
 - Average severity: population stable
 - Mild winters: population increases 10% / year
 - Severe winters: population decreases 10% /year
- In 1/3 of years, population either increases or decreases at least 10%
