*“My view of sustainable architecture is essentially the humanizing of the built environment. Whilst the intelligent development of technology is critical to our quality of life (clean power, nano-technology), immediate improvements can be achieved by opening windows, more imaginative use of landscape, more fluid spaces, use of natural light—resulting in spaces that are both technically more efficient and also more agreeable spaces for people to live and work in, promoting a greater degree of connectivity between people and nature. By fusing social concerns, technological and structural innovation and environmentally responsible design, I’m convinced that a truly modern architecture for the 21st century can be created.”*

-Richard Rogers
