### CONCLUSION

Understanding quality of light from Monet's point of view to actually seeing it yourself through the camera lens was very interesting. We found out that it was quite hard to get the variation in colors reflected on the building as it only happened during golden hours, sunset and sunrise. It was also important to have selected that particular side of the building and the surrounding elements did not cover the sky.

However, this was a great exercise to learn the sun angles, hours of natural light in respect to length of days. Even the quality of sunlight changed from summer to late fall from being very stark and hot to warm and crisp. Late fall in Moscow were a lot cloudy, rainy and we had some snow. Winter has started to be more white- the sky is white, and it snows and the ground is white.

## **ROUNDHOUSE WORKS**

![](_page_24_Picture_0.jpeg)

Roundhouse Works provides space and state-of-the-art facilities to support young people to turn their creativity into a career, doubling the number of 11–30-year-olds the Roundhouse currently works with each year to 15,000. The new building houses a bespoke large music studio, a triple-height studio for circus and performance, a large multi-use studio for workshops, and a dedicated podcast studio run by Transmission Roundhouse.

### STRENGTHS AND WEAKNESSES

In Lighting

![](_page_29_Picture_2.jpeg)

![](_page_30_Picture_0.jpeg)

### STRENGTHS

![](_page_30_Picture_2.jpeg)

#### IMPROVED SAFETY

#### INCREASED PRODUCTIVITY

The upgraded lighting system significantly improves safety within the Roundhouse. Enhanced visibility reduces the risk of accidents, which is particularly important in a facility where potential accidents could happen. The improved lighting conditions lead to increased productivity among maintenance crews. Technicians can perform tasks more efficiently and with greater precision, resulting in faster turnaround times for repairs and maintenance.

#### ENERGY EFFICIENCY

The new lighting system incorporates energyefficient LED fixtures, reducing energy consumption and operational costs. This helps the Roundhouse meet sustainability goals and reduce its environmental footprint.

### FLEXIBILITY

The lighting system is designed with flexibility in mind. It includes dimming controls and adjustable color temperature options, allowing for customization based on specific tasks and time of day.

#### ENHANCED AESTHETICS

The upgraded lighting not only serves functional purposes but also enhances the architectural beauty of the Roundhouse. Carefully designed lighting highlights the historical features of the building, making it more visually appealing to visitors.

![](_page_31_Picture_0.jpeg)

### WEAKNESSES

![](_page_31_Picture_2.jpeg)

#### LACK OF DAYLIGHT DISTRIBUTION

The only light source of daylight is the long rectangular window that is about 20 feet off the floor on the west side and it doesn't bring in enough light as it is.

#### LACK OF VISUAL CONNECTION TO THE OUTSIDE

With the window being so high off the ground, it is difficult for users to feel a visual connection to the outside world.

### GLARE FROM THE WEST

With the only window being on the west side, the glare is more harsh in the later parts of the day. Where it would be more beneficial to access more day light from different directions in other parts of the day

#### DEPENDENCY ON ELECTRICAL LIGHTING

With the lack of daylight available to the space, a higher dependency on electrical lighting is necessary

#### HISTORICAL CONFLICTS

With new lighting systems comes the confliction of historians that may not be amenable to a new and more modern lighting strategy

### CLIMATE

#### Summers

Temperatures are usually very pleasant in the summer and don't often exceed an excessive uncomfortable temperature.

18°C to 23°C (64°F to 73°F)

#### Winters

Winters are fairly cool but pleasant when the sun is out. This due to London being a temperate oceanic climate.

2°C to 8°C (36°F to 46°F)

#### **Overall Yearly Weather**

London will usually see rainfall more than half of its year. So, London is fairly cloudy place because it is an oceanic climate

#### Location: London, UK

#### Climate: (Köppen-Geiger) **Cfb: Humid- temperate oceanic climate**

- Lots of rainfall
- Average Temperature: 51.4° F

Latitude: **51.51 degrees North** Heating Days: **4638.9 °F** base temp. 65° F Cooling Days: **180.5 °F** base temp. 65° F

The studio is very dimly lit from the only window present on the West side. Even though the images show red as high amount of light, it is only 100 lux- maximum lighting reaching to 220 lux. Most of the area has about 50 lux which is not enough for most works. 150 –200 lux is good for household activities and 300-500 lux for offices and focused activities.

Remodeling for the new architect's office we need a lot of daylighting into the space. We had about 50 lux average. With the addition of windows and skylight we have around 200 lux at workstation spaces for the architects. The meeting room is well-lit with 300-400 lux.

Most of the spaces have adequate light for working. Library and principal's office get light from the South windows. We have a little glare from the NW summer sun on the higher walls. The angled North skylight is angled to avoid the direct sun. Overall, the lighting is well.

#### ANALYSIS - DIGITAL MODEL V.S. PHYSICAL MODEL

#### <u>Lighting Analysis – 12-04-2023</u> Errors:

-Human error is involved when we are using electric lighting to simulate the sun, and this can cause skewed results.

-Camera error can make spaces look darker or brighter depending on aperture/iso/shutter speed

#### **Differences:**

-From initial findings we can see that the light isn't being distributed as evenly in the physical model as it is in the digital model.

-Physical Models seem to have different lighting scenarios as one is actual being lit from the sun rather than a spotlight

#### Similar:

-We can see that the digital and physical model both share the same experience of extreme light along the walls and floor areas.

![](_page_53_Picture_0.jpeg)

### CONCLUSION

Analyzing a built space for its Natural lighting through a physical and digital model was a good exercise as the spaces we chose were not accessible due to the distance. Using AGI32 for lighting analysis helped a lot to understand the nature of Natural daylight.

Remodeling the space for a new use expanded the idea from understanding into implementation. The location, surrounding and site context and the local climate affects the daylighting. Using all these we made a box with one window into a light filled architects' office.

We did get discrepancies in digital vs physical model light analysis due to difference in sun positions. We could have gotten better comparisons had we tried to position the spotlight precisely for a particular time and had digital analysis for the same.
